The Pitch

Slide 1

Have you ever thought that, "This particular government form is taking more time... more understanding," <Long pause> or rather have you thought of scrapping everything you filled in the form and just copy whatever an influencer is telling us to do without even a spec of understanding.

Now why do you think this occurs. From where I stand, I will say that this is due to the lack of proper guidance in the given website.

Now, how can we solve this issue.

Slide 2

First guess, give the webpage a chatbot, someone who can answer any and all questions that yo can thow onto it.

And why not, it is always available... at any point of time, gives you te answer in seconds, aand to be fair the best place to resolve any common questions.

But it also fails...

slide 3

You see chatbots are divided in two divisions, scripted chatbots that are limited to what hr thought the users would ask for.

And LLM chatbots(In simple terms ai powered chatbots), which is a go to,

But the element that limits the potential of a correct and easy to explain answers is the ability of us... humans, who need to know what exactly they want to ask.

Even if the user provides the prompt the answer provided may be wrong due to, simply... wrong understanding of what the question was trying to say.

But still I would say this could the best way for this issue.

But...

Slide 4

Lets come back to it in a while.

Do you know what is the first step after you enter in this website to file an ITR?

pretty difficult to spot at on first try, the login/register buttons on the top right of the webpage.

now wouldn't it be easier if we could reduce the traffic surrounded in this webpage?

Now how does it connect us to the method better than a standard answer of a chat-box?

Slide 5

The answer would be to add a simple, but powerful understanding layer.

The answer is straight-forward, "While chatbots wait for the right question, the right interface answers it before it is even asked.

Having proper explanation of what to do properly explained,

Mismatched flags would be easily handled.

Having a progress bar showing what is completed and what remains for users to know how much more of the form still remains.
